

CROP INSURANCE HANDBOOK UPDATE

Applicable to Catastrophic Risk Protection (CAT), Limited and Additional Coverage

Additional Category B APH (Annual) Crop Procedure

Acceptable Actual Production History (APH) Records for Cabbage (Fresh Market and Processing)

The following procedures provide information in addition to the Crop Insurance Handbook for calculating APH yields for cabbage.

If farm management records are used to support production reports, they must be substantiated by records from a marketing outlet, processor, packer, first handler, etc. Boxes, Bags, Cartons, other fifty pound equivalents, or tons of production must be converted to hundredweight (One hundred pounds avoirdupois).

Acceptable Supporting Records: Production that is sold or delivered at the time of harvest must include cabbage sold for fresh market or processing cabbage and account for culled cabbage. Acceptable supporting records for:

- 1 Processed cabbage are settlement sheets that show the weight for which the producer is paid.
- 2 Fresh market cabbage are settlement sheets that show the packout weight (weight of packed cabbage for which the producer is paid).

Farm Stored Production: Production records are required that show the gross weight of stored cabbage if an inspection is not made prior to cabbage being placed in storage. A copy of the weight slips and production measurements must be provided.

Separate production reports (yields) by practice, type, or variety may be required to establish an APH yield if different "T" Yields are provided on the actuarial table.
